## 1 DP

### 1.1 LongestIncreasingSubsequence

*Input:* array *arr* containing a sequence and empty array *p* of length *arr.length* for storing indices of the LIS

*Output:* array *s* containing the longest increasing subsequence

```

1 public static int[] LISfast(int[] arr, int[] p) {
2     // p[k] stores index of the predecessor of arr[k]
3     // in the LIS ending at arr[k]
4     // m[j] stores index k of smallest value arr[k]
5     // so there is a LIS of length j ending at arr[k]
6     int[] m = new int[arr.length+1];
7     int l = 0;

```

```

8  for(int i = 0; i < arr.length; i++) {
9      // bin search for the largest positive j <= l
10     // with arr[m[j]] < arr[i]
11     int lo = 1;
12     int hi = l;
13     while(lo <= hi) {
14         int mid = (int) (((lo + hi) / 2.0) + 0.6);
15         if(arr[m[mid]] <= arr[i])
16             lo = mid+1;
17         else
18             hi = mid-1;
19     }
20     // lo is 1 greater than length of the
21     // longest prefix of arr[i]
22     int newL = lo;
23     p[i] = m[newL-1];
24     m[newL] = i;
25     // if LIS found is longer than the ones
26     // found before, then update l
27     if(newL > l)
28         l = newL;
29 }
30 // reconstruct the LIS
31 int[] s = new int[l];
32 int k = m[l];
33 for(int i = l-1; i >= 0; i--) {
34     s[i] = arr[k];
35     k = p[k];
36 }
37 return s;
38 }

```

## 2 DataStructures

### 2.1 Fenwick-Tree

Can be used for computing prefix sums.

```

1 //note that 0 can not be used
2 int[] fwktree = new int[m + n + 1];
3 public static int read(int index, int[] fenwickTree) {
4     int sum = 0;
5     while (index > 0) {
6         sum += fenwickTree[index];
7         index -= (index & -index);
8     }
9     return sum;
10 }
11 public static int[] update(int index, int addValue,
12     int[] fenwickTree) {
13     while (index <= fenwickTree.length - 1) {
14         fenwickTree[index] += addValue;
15         index += (index & -index);
16     }
17     return fenwickTree;
18 }

```

MD5: 410185d657a3a5140bde465090ff6fb5 |  $\mathcal{O}(\log n)$

### 2.2 Range Maximum Query

*process* processes an array  $A$  of length  $N$  in  $\mathcal{O}(N \log N)$  such that *query* can compute the maximum value of  $A$  in intervals

$[i, j]$ . Therefore  $M[a, b]$  stores the maximum value of interval  $[a, a + 2^b - 1]$ .

*Input*: dynamic table  $M$ , array to search  $A$ , length  $N$  of  $A$ , start index  $i$  and end index  $j$

*Output*: filled dynamic table  $M$  or the maximum value of  $A$  in interval  $[i, j]$

```

1 public static void process(int[][] M, int[] A, int N)
2 {
3     for(int i = 0; i < N; i++)
4         M[i][0] = i;
5     // filling table M
6     // M[i][j] = max(M[i][j-1], M[i+(1<<(j-1))][j-1]),
7     // cause interval of length 2^j can be partitioned
8     // into two intervals of length 2^(j-1)
9     for(int j = 1; 1 <= j <= N; j++) {
10         for(int i = 0; i + (1 <= j) - 1 < N; i++) {
11             if(A[M[i][j-1]] >= A[M[i+(1 <= (j-1))][j-1]])
12                 M[i][j] = M[i][j-1];
13             else
14                 M[i][j] = M[i + (1 <= (j-1))][j-1];
15         }
16     }
17 }
18 public static int query(int[][] M, int[] A, int N,
19     int i, int j) {
20     // k = |_ log_2(j-i+1) _|
21     int k = (int) (Math.log(j - i + 1) / Math.log(2));
22     if(A[M[i][k]] >= A[M[j - (1 <= k) + 1][k]])
23         return M[i][k];
24     else
25         return M[j - (1 <= k) + 1][k];
26 }

```

MD5: db0999fa40037985ff27dd1a43c53b80 |  $\mathcal{O}(N \log N, 1)$

### 2.3 Trie

```

1 public static boolean insert(TrieNode root, String
2     word){
3     char[] s = word.toCharArray();
4     TrieNode node = root;
5     for(int i = 0; i < s.length; ++i){
6         int index = charToIndex(s[i]);
7         if(node.children[index] == null){
8             node.children[index] = new TrieNode(node);
9         }
10        node = node.children[index];
11    }
12    node.isEnd = true;
13    return true;
14 }
15 }
16 }
17 public static boolean search(TrieNode root, String
18     word){
19     char[] s = word.toCharArray();
20     TrieNode node = root;
21     for(int i = 0; i < s.length; ++i){
22         int index = charToIndex(s[i]);
23         if(node.children[index] == null){
24             return false;
25         }
26     }

```

```

26     node = node.children[index];
27 }
28
29 return node.isEnd;
30 }
31
32 public static int charToIndex(char c){
33     return ((int) c - (int) a);
34 }
35
36 static class TrieNode{
37
38     boolean isEnd;
39     TrieNode[] children;
40
41     public TrieNode(){
42         isEnd = false;
43         children = new TrieNode[26];
44     }
45 }

```

## 2.4 Union-Find

Union-Find is a data structure that keeps track of a set of elements partitioned into a number of disjoint subsets. *UnionFind* creates  $n$  disjoint sets each containing one element. *union* joins the sets  $x$  and  $y$  are contained in. *find* returns the representative of the set  $x$  is contained in.

*Input*: number of elements  $n$ , element  $x$ , element  $y$

*Output*: the representative of element  $x$  or a boolean indicating whether sets got merged.

```

1 class UnionFind {
2     private int[] p = null;
3     private int[] r = null;
4     private int count = 0;
5
6     public int count() {
7         return count;
8     } // number of sets
9
10    public UnionFind(int n) {
11        count = n; // every node is its own set
12        r = new int[n]; // every node is its own tree with
13                       // height 0
14        p = new int[n];
15        for (int i = 0; i < n; i++)
16            p[i] = -1; // no parent = -1
17    }
18
19    public int find(int x) {
20        int root = x;
21        while (p[root] >= 0) { // find root
22            root = p[root];
23        }
24        while (p[x] >= 0) { // path compression
25            int tmp = p[x];
26            p[x] = root;
27            x = tmp;
28        }
29        return root;
30    }

```

```

31 // return true, if sets merged and false, if already
32 // from same set
33 public boolean union(int x, int y) {
34     int px = find(x);
35     int py = find(y);
36     if (px == py)
37         return false; // same set -> reject edge
38     if (r[px] < r[py]) { // swap so that always h[px]
39                         // >= h[py]
40         int tmp = px;
41         px = py;
42         py = tmp;
43     }
44     p[py] = px; // hang flatter tree as child of
45                 // higher tree
46     r[px] = Math.max(r[px], r[py] + 1); // update (
47                                     // worst-case) height
48     count--;
49     return true;
50 }

```

## 3 Graph

### 3.1 2SAT

```

1 //We assume that ind(not a) = ind(a) + N, with N being
  //the number of variables
2 //could however be changed easily
3 public static boolean 2SAT(Vertex[] G) {
4     //call SCC
5     double DFS(G);
6     //check for contradiction
7     boolean poss = true;
8     for(int i = 0; i < S+A; i++) {
9         if(G[i].comp == G[i + (S+A)].comp) {
10             poss = false;
11         }
12     }
13     return poss;
14 }

```

MD5: 6c06a2b59fd3a7df3c31b06c58fdaaf5 |  $\mathcal{O}(V + E)$ 

### 3.2 Breadth First Search

Iterative BFS. Uses ref Vertex class, no Edge class needed. In this version we look for a shortest path from  $s$  to  $t$  though we could also find the BFS-tree by leaving out  $t$ . *Input:* IDs of start and goal vertex and graph as AdjList *Output:* true if there is a connection between  $s$  and  $g$ , false otherwise

```

1 public static boolean BFS(Vertex[] G, int s, int t) {
2     //make sure that Vertices vis values are false etc
3     Queue<Vertex> q = new LinkedList<Vertex>();
4     G[s].vis = true;
5     G[s].dist = 0;
6     G[s].pre = -1;
7     q.add(G[s]);
8     //expand frontier between undiscovered and
9     //discovered vertices
10    while(!q.isEmpty()) {
11        Vertex u = q.poll();
12        //when reaching the goal, return true
13        //if we want to construct a BFS-tree delete this
14        //line
15        if(u.id == t) return true;
16        //else add adj vertices if not visited
17        for(Vertex v : u.adj) {
18            if(!v.vis) {
19                v.vis = true;
20                v.dist = u.dist + 1;
21                v.pre = u.id;
22                q.add(v);
23            }
24        }
25    }
26    //did not find target
27    return false;
28 }

```

MD5: 71f3fa48b4f1b2abdf3557a27a9a136 |  $\mathcal{O}(|V| + |E|)$ 

### 3.3 BellmanFord

Finds shortest paths from a single source. Negative edge weights are allowed. Can be used for finding negative cycles.

```

1 public static boolean bellmanFord(Vertex[] G) {
2     //source is 0
3     G[0].dist = 0;
4     //calc distances
5     //the path has max length |V|-1
6     for(int i = 0; i < G.length-1; i++) {
7         //each iteration relax all edges
8         for(int j = 0; j < G.length; j++) {
9             for(Edge e : G[j].adj) {
10                 if(G[j].dist != Integer.MAX_VALUE
11                     && e.t.dist > G[j].dist + e.w) {
12                     e.t.dist = G[j].dist + e.w;
13                 }
14             }
15         }
16     }
17     //check for negative-length cycle
18     for(int i = 0; i < G.length; i++) {
19         for(Edge e : G[i].adj) {
20             if(G[i].dist != Integer.MAX_VALUE
21                 && e.t.dist > G[i].dist + e.w) {
22                 return true;
23             }
24         }
25     }
26 }

```

```

23     }
24 }
25 }
26 return false;
27 }

```

MD5: d101e6b6915f012b3f0c02dc79e1fc6f |  $\mathcal{O}(|V| \cdot |E|)$

### 3.4 Bipartite Graph Check

Checks a graph represented as adjList for being bipartite. Needs a little adaption, if the graph is not connected.

*Input:* graph as adjList, amount of nodes  $N$  as int

*Output:* true if graph is bipartite, false otherwise

```

1 public static boolean bipartiteGraphCheck(Vertex[] G){
2     // use bfs for coloring each node
3     G[0].color = 1;
4     Queue<Vertex> q = new LinkedList<Vertex>();
5     q.add(G[0]);
6     while(!q.isEmpty()) {
7         Vertex u = q.poll();
8         for(Vertex v : u.adj) {
9             // if node i not yet visited,
10            // give opposite color of parent node u
11            if(v.color == -1) {
12                v.color = 1-u.color;
13                q.add(v);
14            } // if node i has same color as parent node u
15            // the graph is not bipartite
16            else if(u.color == v.color)
17                return false;
18            // if node i has different color
19            // than parent node u keep going
20        }
21    }
22    return true;
23 }

```

MD5: e93d242522e5b4085494c86f0d218dd4 |  $\mathcal{O}(|V| + |E|)$

### 3.5 Maximum Bipartite Matching

Finds the maximum bipartite matching in an unweighted graph using DFS.

*Input:* An unweighted adjacency matrix boolean[M][N] with M nodes being matched to N nodes.

*Output:* The maximum matching. (For getting the actual matching, little changes have to be made.)

```

1 // A DFS based recursive function that returns true
2 // if a matching for vertex u is possible
3 boolean bpm(boolean bpGraph[][], int u,
4             boolean seen[], int matchR[]) {
5     // Try every job one by one
6     for (int v = 0; v < N; v++) {
7         // If applicant u is interested in job v and v
8         // is not visited
9         if (bpGraph[u][v] && !seen[v]) {
10            seen[v] = true; // Mark v as visited
11
12            // If job v is not assigned to an applicant OR
13            // previously assigned applicant for job v
14            // (which is matchR[v]) has an alternate job

```

```

// available. Since v is marked as visited in
// the above line, matchR[v] in the following
// recursive call will not get job v again
if (matchR[v] < 0 ||
    bpm(bpGraph, matchR[v], seen, matchR)) {
    matchR[v] = u;
    return true;
}
}
}
return false;
}
}

// Returns maximum number of matching from M to N
int maxBPM(boolean bpGraph[][]) {
    // An array to keep track of the applicants assigned
    // to jobs. The value of matchR[i] is the applicant
    // number assigned to job i, the value -1 indicates
    // nobody is assigned.
    int matchR[] = new int[N];
    // Initially all jobs are available
    for(int i = 0; i < N; ++i)
        matchR[i] = -1;
    // Count of jobs assigned to applicants
    int result = 0;
    for (int u = 0; u < M; u++) {
        // Mark all jobs as not seen for next applicant.
        boolean seen[] = new boolean[N];
        for(int i = 0; i < N; ++i)
            seen[i] = false;
        // Find if the applicant u can get a job
        if (bpm(bpGraph, u, seen, matchR))
            result++;
    }
    return result;
}

```

MD5: a4cc90bf91c41309ad7aaa0c2514ff06 |  $\mathcal{O}(M \cdot N)$

### 3.6 Bitonic TSP

*Input:* Distance matrix  $d$  with vertices sorted in x-axis direction.

*Output:* Shortest bitonic tour length

```

1 public static double bitonic(double[][] d) {
2     int N = d.length;
3     double[][] B = new double[N][N];
4     for (int j = 0; j < N; j++) {
5         for (int i = 0; i <= j; i++) {
6             if (i < j - 1)
7                 B[i][j] = B[i][j - 1] + d[j - 1][j];
8             else {
9                 double min = 0;
10                for (int k = 0; k < j; k++) {
11                    double r = B[k][i] + d[k][j];
12                    if (min > r || k == 0)
13                        min = r;
14                }
15                B[i][j] = min;
16            }
17        }
18    }
19    return B[N-1][N-1];
20 }

```

MD5: 49fca508fb184da171e4c8e18b6ca4c7 |  $\mathcal{O}(?)$

### 3.7 Single-source shortest paths in dag

Not tested but should be working fine Similar approach can be used for longest paths. Simply go through ts and add 1 to the largest longest path value of the incoming neighbors

```

1 public static void dagSSP(Vertex[] G, int s) {
2     //calls topological sort method
3     LinkedList<Integer> sorting = TS(G);
4     G[s].dist = 0;
5     //go through vertices in ts order
6     for(int u : sorting) {
7         for(Edge e : G[u].adj) {
8             Vertex v = e.t;
9             if(v.dist > u.dist + e.w) {
10                 v.dist = u.dist + e.w;
11                 v.pre = u.id;
12             }
13         }
14     }
15 }

```

MD5: 552172db2968f746c4ac0bd322c665f9 |  $\mathcal{O}(|V| + |E|)$

### 3.8 Dijkstra

Finds the shortest paths from one vertex to every other vertex in the graph (SSSP).

For negative weights, add  $|\min|+1$  to each edge, later subtract from result.

To get a different shortest path when edges are ints, add an  $\varepsilon = \frac{1}{k+1}$  on each edge of the shortest path of length  $k$ , run again.

*Input:* A source vertex  $s$  and an adjacency list  $G$ .

*Output:* Modified adj. list with distances from  $s$  and predecessor vertices set.

```

1 public static void dijkstra(Vertex[] G, int s) {
2     G[s].dist = 0;
3     Tuple st = new Tuple(s, 0);
4     PriorityQueue<Tuple> q = new PriorityQueue<Tuple>();
5     q.add(st);
6
7     while(!q.isEmpty()) {
8         Tuple sm = q.poll();
9         Vertex u = G[sm.id];
10        //this checks if the Tuple is still useful, both
11        //checks should be equivalent
12        if(u.vis || sm.dist > u.dist) continue;
13        u.vis = true;
14        for(Edge e : u.adj) {
15            Vertex v = e.t;
16            if(!v.vis && v.dist > u.dist + e.w) {
17                v.pre = u.id;
18                v.dist = u.dist + e.w;
19                Tuple nt = new Tuple(v.id, v.dist);
20                q.add(nt);
21            }
22        }
23    }
24 }

```

MD5: e46eb1b919179dab6a42800376f04d7a |  $\mathcal{O}(|E| \log |V|)$

### 3.9 EdmondsKarp

Finds the greatest flow in a graph. Capacities must be positive.

```

1 public static boolean BFS(Vertex[] G, int s, int t) {
2     int N = G.length;
3     for(int i = 0; i < N; i++) {
4         G[i].vis = false;
5     }
6
7     Queue<Vertex> q = new LinkedList<Vertex>();
8     G[s].vis = true;
9     G[s].pre = -1;
10    q.add(G[s]);
11
12    while(!q.isEmpty()) {
13        Vertex u = q.poll();
14        if(u.id == t) return true;
15        for(int i : u.adj.keySet()) {
16            Edge e = u.adj.get(i);
17            Vertex v = e.t;
18            if(!v.vis && e.rw > 0) {
19                v.vis = true;
20                v.pre = u.id;
21                q.add(v);
22            }
23        }
24    }
25    return (G[t].vis);
26 }
27 //We store the edges in the graph in a hashmap
28 public static int edKarp(Vertex[] G, int s, int t) {
29     int maxflow = 0;
30     while(BFS(G, s, t)) {
31         int pflow = Integer.MAX_VALUE;
32         for(int v = t; v != s; v = G[v].pre) {
33             int u = G[v].pre;
34             pflow = Math.min(pflow, G[u].adj.get(v).rw);
35         }
36         for(int v = t; v != s; v = G[v].pre) {
37             int u = G[v].pre;
38             G[u].adj.get(v).rw -= pflow;
39             G[v].adj.get(u).rw += pflow;
40         }
41         maxflow += pflow;
42     }
43     return maxflow;
44 }

```

MD5: 6067fa877ff237d82294e7511c79d4bc |  $\mathcal{O}(|V|^2 \cdot |E|)$

### 3.10 Reference for Edge classes

Used for example in Dijkstra algorithm, implements edges with weight. Needs testing.

```

1 //for Kruskal we need to sort edges, use: java.lang.
2 //Comparable
3 class Edge implements Comparable<Edge> {}
4
5 class Edge {
6     //for Kruskal it is helpful to store the start as
7     //well, moreover we might not need the vertex class
8     int s;
9     int t;
10
11    //for EdKarp we also want to store residual weights

```

```

11  int rw;
12
13  Vertex t;
14  int w;
15
16  public Edge(Vertex t, int w) {
17      this.t = t;
18      this.w = w;
19      this.rw = w;
20  }
21
22  public Edge(int s, int t, int w) {...}
23
24  public int compareTo(Edge other) {
25      return Integer.compare(this.w, other.w);
26  }
27 }

```

MD5: aae80ac4bfbfcc0b9ac4c65085f6f123 |  $\mathcal{O}(1)$

### 3.11 FloydWarshall

Finds all shortest paths. Paths in array next, distances in ans.

```

1  public static void floydWarshall(int[][] graph,
2      int[][] next, int[][] ans) {
3      for(int i = 0; i < ans.length; i++)
4          for(int j = 0; j < ans.length; j++)
5              ans[i][j] = graph[i][j];
6
7      for (int k = 0; k < ans.length; k++)
8          for (int i = 0; i < ans.length; i++)
9              for (int j = 0; j < ans.length; j++)
10                 if (ans[i][k] + ans[k][j] < ans[i][j]
11                     && ans[i][k] < Integer.MAX_VALUE
12                     && ans[k][j] < Integer.MAX_VALUE) {
13                     ans[i][j] = ans[i][k] + ans[k][j];
14                     next[i][j] = next[i][k];
15                 }
16 }

```

MD5: a98bbda7e53be8ee0df72dbd8721b306 |  $\mathcal{O}(|V|^3)$

### 3.12 Held Karp

Algorithm for TSP

```

1  public static int[] tsp(int[][] graph) {
2      int n = graph.length;
3      if(n == 1) return new int[]{0};
4      //C stores the shortest distance to node of the
5      //second dimension, first dimension is the
6      //bitstring of included nodes on the way
7      int[][] C = new int[1<n][n];
8      int[][] p = new int[1<n][n];
9      //initialize
10     for(int k = 1; k < n; k++) {
11         C[1<k][k] = graph[0][k];
12     }
13     for(int s = 2; s < n; s++) {
14         for(int S = 1; S < (1<n); S++) {
15             if(Integer.bitCount(S)!=s || (S&1) == 1)
16                 continue;
17             for(int k = 1; k < n; k++) {
18                 if((S & (1 < k)) == 0) continue;

```

```

17     //Smk is the set of nodes without k
18     int Smk = S ^ (1<k);
19
20     int min = Integer.MAX_VALUE;
21     int minprev = 0;
22     for(int m=1; m<n; m++) {
23         if((Smk & (1<m)) == 0) continue;
24         //distance to m with the nodes in Smk +
25         //connection from m to k
26         int tmp = C[Smk][m] + graph[m][k];
27         if(tmp < min) {
28             min = tmp;
29             minprev = m;
30         }
31     }
32     C[S][k] = min;
33     p[S][k] = minprev;
34 }
35 }
36
37 //find shortest tour length
38 int min = Integer.MAX_VALUE;
39 int minprev = -1;
40 for(int k = 1; k < n; k++) {
41     //Set of all nodes except for the first + cost
42     //from 0 to k
43     int tmp = C[(1<n) - 2][k] + graph[0][k];
44     if(tmp < min) {
45         min = tmp;
46         minprev = k;
47     }
48 }
49
50 //Note that the tour has not been tested yet, only
51 //the correctness of the min-tour-value backtrack
52 //tour
53 int[] tour = new int[n+1];
54 tour[n] = 0;
55 tour[n-1] = minprev;
56 int bits = (1<n)-2;
57 for(int k = n-2; k>0; k--) {
58     tour[k] = p[bits][tour[k+1]];
59     bits = bits ^ (1<tour[k+1]);
60 }
61 tour[0] = 0;
62 return tour;
63 }

```

MD5: f3e9730287dcbf2695bf7372fc4baf0 |  $\mathcal{O}(2^n n^2)$

### 3.13 Iterative DFS

Simple iterative DFS, the recursive variant is a bit fancier. Not tested.

```

1 //if we want to start the DFS for different connected
2 //components, there is such a method in the
3 //recursive variant of DFS
4 public static boolean ItDFS(Vertex[] G, int s, int t){
5     //take care that all the nodes are not visited at
6     //the beginning
7     Stack<Integer> S = new Stack<Integer>();
8     s.push(s);
9     while(!S.isEmpty()) {
10         int u = S.pop();
11         if(u.id == t) return true;

```

```

9     if(!G[u].vis) {
10         G[u].vis = true;
11         for(Vertex v : G[u].adj) {
12             if(!v.vis)
13                 S.push(v.id);
14         }
15     }
16 }
17 return false;
18 }

```

MD5: 80f28ea9b2a04af19b48277e3c6bce9e |  $\mathcal{O}(|V| + |E|)$

### 3.14 Johnsons Algorithm

```

1 public static int[][] johnson(Vertex[] G) {
2     Vertex[] Gd = new Vertex[G.length+1];
3     int s = G.length;
4     for(int i = 0; i < G.length; i++)
5         Gd[i] = G[i];
6     //init new vertex with zero-weight-edges to each
        vertex
7     Vertex S = new Vertex(G.length);
8     for(int i = 0; i < G.length; i++)
9         S.adj.add(new Edge(Gd[i], 0));
10    Gd[G.length] = S;
11
12    //bellman-ford to check for neg-weight-cycles and to
        adapt edges to enable running dijkstra
13    if(bellmanFord(Gd, s)) {
14        System.out.println("False");
15        //this should not happen and will cause troubles
16        return null;
17    }
18    //change weights
19    for(int i = 0; i < G.length; i++)
20        for(Edge e : Gd[i].adj)
21            e.w = e.w + Gd[i].dist - e.t.dist;
22    //store distances to invert this step later
23    int[] h = new int[G.length];
24    for(int i = 0; i < G.length; i++)
25        h[i] = G[i].dist;
26
27    //create shortest path matrix
28    int[][] apsp = new int[G.length][G.length];
29
30    //now use original graph G
31    //start a dijkstra for each vertex
32    for(int i = 0; i < G.length; i++) {
33        //reset weights
34        for(int j = 0; j < G.length; j++) {
35            G[j].vis = false;
36            G[j].dist = Integer.MAX_VALUE;
37        }
38        dijkstra(G, i);
39        for(int j = 0; j < G.length; j++)
40            apsp[i][j] = G[j].dist + h[j] - h[i];
41    }
42    return apsp;
43 }

```

MD5: 0a5c741be64b65c5211fe6056ffc1e02 |  $\mathcal{O}(|V|^2 \log V + VE)$

### 3.15 Kruskal

Computes a minimum spanning tree for a weighted undirected graph.

```

1 public static int kruskal(Edge[] edges, int n) {
2     Arrays.sort(edges);
3     //n is the number of vertices
4     UnionFind uf = new UnionFind(n);
5     //we will only compute the sum of the MST, one could
        of course also store the edges
6     int sum = 0;
7     int cnt = 0;
8     for(int i = 0; i < edges.length; i++) {
9         if(cnt == n-1) break;
10        if(uf.union(edges[i].s, edges[i].t)) {
11            sum += edges[i].w;
12            cnt++;
13        }
14    }
15    return sum;
16 }

```

MD5: 91a1657706750a76d384d3130d98e5fb |  $\mathcal{O}(|E| + \log |V|)$

### 3.16 Min Cut

Calculates the min cut using Edmonds Karp algorithm.

```

1 public static void bfs(Vertex[] G, int s) {
2     for(int i = 0; i < G.length; i++) {
3         G[i].vis = false;
4     }
5     Queue<Vertex> q = new LinkedList<Vertex>();
6     q.add(G[s]);
7
8     while(!q.isEmpty()) {
9         Vertex u = q.poll();
10        u.vis = true;
11
12        for(int i : u.adj.keySet()) {

### 3.18 Recursive Depth First Search

Recursive DFS with different options (storing times, connected/unconnected graph). Needs testing.

*Input:* A source vertex  $s$ , a target vertex  $t$ , and adjlist  $G$  and the time (0 at the start)

*Output:* Indicates if there is connection between  $s$  and  $t$ .

```

1 //if we want to visit the whole graph, even if it is
  not connected we might use this
2 public static void DFS(Vertex[] G) {
3     //make sure all vertices vis value is false etc
4     int time = 0;
5     for(int i = 0; i < G.length; i++) {
6         if(!G[i].vis) {
7             //note that we leave out t so this does not work
              with the below function
8             //adaption will not be too difficult though
9             //time should not always start at zero, change
              if needed

```

```

10    recDFS(i, G, 0);
11    }
12    }
13 }
14
15 //first call with time = 0
16 public static boolean recDFS(int s, int t, Vertex[] G,
    int time){
17     //it might be necessary to store the time of
        discovery

### 3.20 Suurballe

Finds the min cost of two edge disjoint paths in a graph. If vertex disjoint needed, split vertices.

*Input:* Graph  $G$ , Source  $s$ , Target  $t$

*Output:* Min cost as int

```

1 public static int suurballe(Vertex[] G, int s, int t){
2     //this uses the usual dijkstra implementation with
3     //stored predecessors
4     dijkstra(G, s);
5     //Modifying weights
6     for(int i = 0; i < G.length; i++)
7         for(Edge e : G[i].adj)
8             e.dist = e.dist - e.t.dist + G[i].dist;
9     //reversing path and storing used edges
10    int old = t;
11    int pre = G[t].pre;
12    HashMap<Integer, Integer> hm = new HashMap<Integer,
13    Integer>();
14    while(pre != -1) {
15        for(int i = 0; i < G[pre].adj.size(); i++) {
16            if(G[pre].adj.get(i).t.id == old) {
17                hm.put(pre * G.length + old, G[pre].adj.get(i)
18                .tdist);
19                G[pre].adj.remove(i);
20                break;
21            }
22        }
23        boolean found = false;
24        for(int i = 0; i < G[old].adj.size(); i++) {
25            if(G[old].adj.get(i).t.id == pre) {
26                G[old].adj.get(i).dist = 0;
27                found = true;
28                break;
29            }
30        }
31        if(!found)
32            G[old].adj.add(new Edge(G[pre], 0));
33        old = pre;
34        pre = G[pre].pre;
35    }
36    //reset graph
37    for(int i = 0; i < G.length; i++) {
38        G[i].pre = -1;
39        G[i].dist = Integer.MAX_VALUE;
40        G[i].vis = false;
41    }
42    dijkstra(G, s);
43    //store edges of second path
44    old = t;
45    pre = G[t].pre;
46    while(pre != -1) {
47        //store edges and remove if reverse

```

```

46    for(int i = 0; i < G[pre].adj.size(); i++) {
47        if(G[pre].adj.get(i).t.id == old) {
48            if(!hm.containsKey(pre + old * G.length))
49                hm.put(pre * G.length + old, G[pre].adj.get(
50                i).tdist);
51            else
52                hm.remove(pre + old * G.length);
53            break;
54        }
55    }
56    old = pre;
57    pre = G[pre].pre;
58    }
59    //sum up weights
60    int sum = 0;
61    for(int i : hm.keySet())
62        sum += hm.get(i);
63    return sum;
64 }

```

MD5: 222dac2a859273efbddd0ec0d6285dd7 |  $\mathcal{O}(V \log V + E)$

### 3.21 Kahns Algorithm for TS

Gives the specific TS where Vertices first in  $G$  are first in the sorting

```

1 public static LinkedList<Integer> TS(Vertex[] G) {
2     LinkedList<Integer> sorting = new LinkedList<Integer>
3     >();
4     PriorityQueue<Vertex> p = new PriorityQueue<Vertex>
5     >();
6     //inc counts the number of incoming edges, if they
7     //are zero put the vertex in the queue
8     for(int i = 0; i < G.length; i++) {
9         if(G[i].inc == 0) {
10            p.add(G[i]);
11            G[i].vis = true;
12        }
13    }
14    while(!p.isEmpty()) {
15        Vertex u = p.poll();
16        sorting.add(u.id);
17        //update inc
18        for(Vertex v : u.out) {
19            if(v.vis) continue;
20            v.inc--;
21            if(v.inc == 0) {
22                p.add(v);
23                v.vis = true;
24            }
25        }
26    }
27    return sorting;
28 }

```

MD5: e53d13c7467873d1c5d210681f4450d8 |  $\mathcal{O}(V + E)$

### 3.22 Topological Sort

```

1 public static LinkedList<Integer> TS(Vertex[] G) {
2     LinkedList<Integer> sorting = new LinkedList<Integer>
3     >();
4     for(int i = 0; i < G.length; i++)
5         if(!G[i].vis)

```

```

5     recTS(G[i], sorting);
6     //check sorting for a -1 if the graph is not
        necessarily dag
7     //maybe checking if there are too many values in
        sorting is easier?!
8     return sorting;
9 }
10
11 public static LinkedList<Integer> recTS(Vertex u,
        LinkedList<Integer> sorting) {
12     u.vis = true;
13     for(Vertex v : u.adj)
14         if(v.vis)
15             //the -1 indicates that it will not be possible
                to find an TS
16             //there might be a much faster and elegant way (
                flag?!)
17             sorting.addFirst(-1);
18         else
19             recTS(v, sorting);
20     sorting.addFirst(u.id);
21     return sorting;
22 }

```

MD5: f6459575bf0d53344ddd9e5daf1dfbb8 |  $\mathcal{O}(|V| + |E|)$

```

13 //for DFS we could store the start and finishing
        times
14 int dtime = -1;
15 int ftime = -1;
16
17 //use an ArrayList of Edges if those information are
        needed
18 ArrayList<Edge> adj = new ArrayList<Edge>();
19 //use an ArrayList of Vertices else
20 ArrayList<Vertex> adj = new ArrayList<Vertex>();
21 //use two ArrayLists for SCC
22 ArrayList<Vertex> in = new ArrayList<Vertex>();
23 ArrayList<Vertex> out = new ArrayList<Vertex>();
24
25 //for EdmondsKarp we need a HashMap to store Edges,
        Integer is target
26 HashMap<Integer, Edge> adj = new HashMap<Integer,
        Edge>();
27
28 //for bipartite graph check
29 int color = -1;
30
31 //we store as key the target
32 public Vertex(int id) {
33     this.id = id;
34 }
35 }

```

MD5: 90e8120ce9f665b07d4388e30395dd36 |  $\mathcal{O}(1)$

### 3.23 Tuple

Simple tuple class used for priority queue in Dijkstra and Prim

```

1 class Tuple implements Comparable<Tuple> {
2
3     int id;
4     int dist;
5
6     public Tuple(int id, int dist) {
7         this.id = id;
8         this.dist = dist;
9     }
10
11     public int compareTo(Tuple other) {
12         return Integer.compare(this.dist, other.dist);
13     }
14 }

```

MD5: fb1aa32dc32b9a2bac6f44a84e7f82c7 |  $\mathcal{O}(1)$

### 3.24 Reference for Vertex classes

Used in many graph algorithms, implements a vertex with its edges. Needs testing.

```

1 class Vertex {
2
3     int id;
4     boolean vis = false;
5     int pre = -1;
6
7     //for dijkstra and prim
8     int dist = Integer.MAX_VALUE;
9
10    //for SCC store number indicating the dedicated
        component
11    int comp = -1;
12 }

```

### 3.25 Dijkstra

Finds the shortest paths from one vertex to every other vertex in the graph (SSSP).

For negative weights, add  $|\min|+1$  to each edge, later subtract from result.

To get a different shortest path when edges are ints, add an  $\varepsilon = \frac{1}{k+1}$  on each edge of the shortest path of length  $k$ , run again.

*Input:* A source vertex  $s$  and an adjacency list  $G$ .

*Output:* Modified adj. list with distances from  $s$  and predecessor vertices set.

```

1 int mxi = (1 << 25);
2
3 bool cmp(pair<int, int> a, pair<int, int> b)
4 {
5     return (a.second > b.second);
6 }
7
8 int dijkstra(vector<vector<pair<int, int>>> &g, int N)
9 {
10    priority_queue<pair<int, int>, vector<pair<int,
        int>>, decltype(cmp)> pq(cmp);
11    vector<int> dist(N, mxi);
12    dist[0] = 0;
13    pq.push({0, 0});
14    while(!pq.empty()) {
15        int u = pq.top().first;
16        int d = pq.top().second;
17        pq.pop();
18        if(d > dist[u]) continue;
19        if(u == N-1) return d;
20        for(auto it = g[u].begin(); it != g[u].end();
            ++it) {
21            int v = it -> first;

```

```

22         int w = it -> second;
23         if(w + dist[u] < dist[v]) {
24             dist[v] = w + dist[u];
25             pq.push({v, dist[v]});
26         }
27     }
28 }
29 return dist[N-1];
30 }

```

MD5: b4e62c815fb25574ef371d1913584c6c |  $\mathcal{O}(|E| \log |V|)$

### 3.26 EdmondsKarp

Finds the greatest flow in a graph. Capacities must be positive.

```

1 #include<iostream>
2 #include<vector>
3 #include<queue>
4 #include<unordered_map>
5 #include<cmath>
6
7 using namespace std;
8
9 bool bfs(vector<unordered_map<int, long long>> &g, int
10 s, int t, vector<int> &pre)
11 {

## 4 Math

### 4.1 Binomial Coefficient

Gives binomial coefficient (n choose k)

```

1 public static long bin(int n, int k) {
2     if (k == 0)
3         return 1;
4     else if (k > n/2)
5         return bin(n, n-k);
6     else
7         return n*bin(n-1, k-1)/k;
8 }

```

MD5: 32414ba5a444038b9184103d28fa1756 |  $\mathcal{O}(k)$

### 4.2 Binomial Matrix

Gives binomial coefficients for all  $K \leq N$ .

```

1 public static long[][] binomial_matrix(int N, int K) {
2     long[][] B = new long[N+1][K+1];
3     for (int k = 1; k <= K; k++)
4         B[0][k] = 0;
5     for (int m = 0; m <= N; m++)
6         B[m][0] = 1;
7     for (int m = 1; m <= N; m++)
8         for (int k = 1; k <= K; k++)
9             B[m][k] = B[m-1][k-1] + B[m-1][k];
10    return B;
11 }

```

MD5: e6f103bd9852173c02a1ec64264f4448 |  $\mathcal{O}(N \cdot K)$

### 4.3 Divisability

Calculates (alternating) k-digitSum for integer number given by M.

```

1 public static long digit_sum(String M, int k, boolean
2 alt) {
3     long dig_sum = 0;
4     int vz = 1;
5     while (M.length() > k) {
6         if (alt) vz *= -1;
7         dig_sum += vz*Integer.parseInt(M.substring(M.
8             length()-k));
9         M = M.substring(0, M.length()-k);
10    }
11    if (alt)
12        vz *= -1;
13    dig_sum += vz*Integer.parseInt(M);
14    return dig_sum;
15 }

```

// example: divisibility of M by 13

```

16 public static boolean divisible13(String M) {
17     return digit_sum(M, 3, true)%13 == 0;
18 }

```

MD5: 33b3094ebf431e1e71cd8e8db3c9cdd6 |  $\mathcal{O}(|M|)$

## 4.4 Graham Scan

Multiple unresolved issues: multiple points as well as collinearity.

$N$  denotes the number of points

```

1 public static Point[] grahamScan(Point[] points) {
2     //find leftmost point with lowest y-coordinate
3     int xmin = Integer.MAX_VALUE;
4     int ymin = Integer.MAX_VALUE;
5     int index = -1;
6     for(int i = 0; i < points.length; i++) {
7         if(points[i].y < ymin || (points[i].y == ymin &&
8             points[i].x < xmin)) {
9             xmin = points[i].x;
10            ymin = points[i].y;
11            index = i;
12        }
13    }
14    //get that point to the start of the array
15    Point tmp = new Point(points[index].x, points[index].y);
16    points[index] = points[0];
17    points[0] = tmp;
18    for(int i = 1; i < points.length; i++)
19        points[i].src = points[0];

## 5 Misc

### 5.1 Binary Search

Binary searches for an element in a sorted array.

*Input:* sorted *array* to search in, amount  $N$  of elements in *array*, element to search for  $a$

*Output:* returns the index of  $a$  in *array* or  $-1$  if *array* does not contain  $a$

```

1 public static int BinarySearch(int[] array,
2                               int N, int a) {
3     int lo = 0;
4     int hi = N-1;
5     // a might be in interval [lo,hi] while lo <= hi
6     while(lo <= hi) {
7         int mid = (lo + hi) / 2;
8         // if a > elem in mid of interval,
9         // search the right subinterval
10        if(array[mid] < a)
11            lo = mid+1;
12        // else if a < elem in mid of interval,
13        // search the left subinterval
14        else if(array[mid] > a)
15            hi = mid-1;
16        // else a is found
17        else
18            return mid;
19    }
20    // array does not contain a
21    return -1;
22 }
```

MD5: 203da61f7a381564ce3515f674fa82a4 |  $\mathcal{O}(\log n)$

### 5.2 Next number with $n$ bits set

From  $x$  the smallest number greater than  $x$  with the same amount of bits set is computed. Little changes have to be made, if the calculated number has to have length less than 32 bits.

*Input:* number  $x$  with  $n$  bits set ( $x = (1 \ll n) - 1$ )

*Output:* the smallest number greater than  $x$  with  $n$  bits set

```

1 public static int nextNumber(int x) {
2     //break when larger than limit here
3     if(x == 0) return 0;
4     int smallest = x & -x;
5     int ripple = x + smallest;
6     int new_smallest = ripple & -ripple;
7     int ones = ((new_smallest/smallest) >> 1) - 1;
8     return ripple | ones;
9 }
```

MD5: 2d8a79cb551648e67fc3f2f611a4f63c |  $\mathcal{O}(1)$

### 5.3 Next Permutation

Returns true if there is another permutation. Can also be used to compute the nextPermutation of an array.

*Input:* String  $a$  as char array

*Output:* true, if there is a next permutation of  $a$ , false otherwise

```

1 public static boolean nextPermutation(char[] a) {
2     int i = a.length - 1;
3     while(i > 0 && a[i-1] >= a[i])
4         i--;
5     if(i <= 0)
6         return false;
7     int j = a.length - 1;
8     while (a[j] <= a[i-1])
9         j--;
10    char tmp = a[i - 1];
11    a[i - 1] = a[j];
12    a[j] = tmp;
13
14    j = a.length - 1;
15    while(i < j) {
16        tmp = a[i];
17        a[i] = a[j];
18        a[j] = tmp;
19        i++;
20        j--;
21    }
22    return true;
23 }
```

13     // System.out.println("length of LCS = " + num[s1.
14     length][s2.length]);
15     int s1position = s1.length, s2position = s2.length;
16     List<Character> result = new LinkedList<Character>();
17     while (s1position != 0 && s2position != 0) {
18         if (s1[s1position - 1] == s2[s2position - 1]) {
19             result.add(s1[s1position - 1]);
20             s1position--;
21             s2position--;
22         } else if (num[s1position][s2position - 1] >= num[
23             s1position][s2position])
24             s2position--;
25         else
26             s1position--;
27     }
28     Collections.reverse(result);
29     char[] resultString = new char[result.size()];
30     int i = 0;
31     for (Character c : result) {
32         resultString[i] = c;
33         i++;
34     }
35     return new String(resultString);
36 }

```

MD5: 4dc4ee3af14306bea5724ba8a859d5d4 |  $\mathcal{O}(n \cdot m)$

### 6.4 Longest common substring

gets two String and finds all LCSs and returns them in a set

```

1 public static TreeSet<String> LCS(String a, String b)
2 {
3     int[][] t = new int[a.length()+1][b.length()+1];
4     for (int i = 0; i <= b.length(); i++)
5         t[0][i] = 0;
6
7     for (int i = 0; i <= a.length(); i++)
8         t[i][0] = 0;
9
10    for (int i = 1; i <= a.length(); i++)
11        for (int j = 1; j <= b.length(); j++)
12            if (a.charAt(i-1) == b.charAt(j-1))
13                t[i][j] = t[i-1][j-1] + 1;
14            else
15                t[i][j] = 0;
16
17    int max = -1;
18    for (int i = 0; i <= a.length(); i++)
19        for (int j = 0; j <= b.length(); j++)
20            if (max < t[i][j])
21                max = t[i][j];
22
23    if (max == 0 || max == -1)
24        return new TreeSet<String>();
25
26    TreeSet<String> res = new TreeSet<String>();
27    for (int i = 0; i <= a.length(); i++)
28        for (int j = 0; j <= b.length(); j++)
29            if (max == t[i][j])
30                res.add(a.substring(i-max, i));
31    return res;
32 }

```

## 7 Math

### 7.1 Tree

Diameter: BFS from any node, then BFS from last visited node. Max dist is then the diameter. Center: Middle vertex in second step from above.

### 7.2 Divisability Explanation

$D \mid M \Leftrightarrow D \mid \text{digit\_sum}(M, k, \text{alt})$ , refer to table for values of  $D, k, \text{alt}$ .

### 7.3 Combinatorics

- Variations (ordered):  $k$  out of  $n$  objects (permutations for  $k = n$ )
  - without repetition:
 
$$M = \{(x_1, \dots, x_k) : 1 \leq x_i \leq n, x_i \neq x_j \text{ if } i \neq j\},$$

$$|M| = \frac{n!}{(n-k)!}$$
  - with repetition:
 
$$M = \{(x_1, \dots, x_k) : 1 \leq x_i \leq n\}, |M| = n^k$$
- Combinations (unordered):  $k$  out of  $n$  objects
  - without repetition:  $M = \{(x_1, \dots, x_n) : x_i \in \{0, 1\}, x_1 + \dots + x_n = k\}, |M| = \binom{n}{k}$
  - with repetition:  $M = \{(x_1, \dots, x_n) : x_i \in \{0, 1, \dots, k\}, x_1 + \dots + x_n = k\}, |M| = \binom{n+k-1}{k}$

- Ordered partition of numbers:  $x_1 + \dots + x_k = n$  (i.e.  $1+3 = 3+1 = 4$  are counted as 2 solutions)
  - #Solutions for  $x_i \in \mathbb{N}_0$ :  $\binom{n+k-1}{k-1}$
  - #Solutions for  $x_i \in \mathbb{N}$ :  $\binom{n-1}{k-1}$
- Unordered partition of numbers:  $x_1 + \dots + x_k = n$  (i.e.  $1+3 = 3+1 = 4$  are counted as 1 solution)
  - #Solutions for  $x_i \in \mathbb{N}$ :  $P_{n,k} = P_{n-k,k} + P_{n-1,k-1}$  where  $P_{n,1} = P_{n,n} = 1$
- Derangements (permutations without fixed points):  $!n = n! \sum_{k=0}^n \frac{(-1)^k}{k!} = \lfloor \frac{n!}{e} + \frac{1}{2} \rfloor$

## 7.4 Polynomial Interpolation

### 7.4.1 Theory

Problem: for  $\{(x_0, y_0), \dots, (x_n, y_n)\}$  find  $p \in \Pi_n$  with  $p(x_i) = y_i$  for all  $i = 0, \dots, n$ .

Solution:  $p(x) = \sum_{i=0}^n \gamma_{0,i} \prod_{j=0}^{i-1} (x - x_j)$  where  $\gamma_{j,k} = y_j$  for  $k = 0$

and  $\gamma_{j,k} = \frac{\gamma_{j+1,k-1} - \gamma_{j,k-1}}{x_{j+1} - x_j}$  otherwise.

Efficient evaluation of  $p(x)$ :  $b_n = \gamma_{0,n}$ ,  $b_i = b_{i+1}(x - x_i) + \gamma_{0,i}$  for  $i = n-1, \dots, 0$  with  $b_0 = p(x)$ .

## 7.5 Fibonacci Sequence

### 7.5.1 Binet's formula

$$\begin{pmatrix} f_n \\ f_{n+1} \end{pmatrix} = \begin{pmatrix} 0 & 1 \\ 1 & 1 \end{pmatrix}^n \begin{pmatrix} 0 \\ 1 \end{pmatrix} \Rightarrow f_n = \frac{1}{\sqrt{5}}(\phi^n - \tilde{\phi}^n) \text{ where } \phi = \frac{1+\sqrt{5}}{2} \text{ and } \tilde{\phi} = \frac{1-\sqrt{5}}{2}.$$

### 7.5.2 Generalization

$$g_n = \frac{1}{\sqrt{5}}(g_0(\phi^{n-1} - \tilde{\phi}^{n-1}) + g_1(\phi^n - \tilde{\phi}^n)) = g_0 f_{n-1} + g_1 f_n$$

for all  $g_0, g_1 \in \mathbb{N}_0$

### 7.5.3 Pisano Period

Both  $(f_n \bmod k)_{n \in \mathbb{N}_0}$  and  $(g_n \bmod k)_{n \in \mathbb{N}_0}$  are periodic.

## 7.6 Reihen

$$\sum_{i=1}^n i = \frac{n(n+1)}{2}, \sum_{i=1}^n i^2 = \frac{n(n+1)(2n+1)}{6}, \sum_{i=1}^n i^3 = \frac{n^2(n+1)^2}{4}$$

$$\sum_{i=0}^n c^i = \frac{c^{n+1}-1}{c-1}, c \neq 1, \sum_{i=0}^{\infty} c^i = \frac{1}{1-c}, \sum_{i=1}^n c^i = \frac{c}{1-c}, |c| < 1$$

$$\sum_{i=0}^n i c^i = \frac{n c^{n+2} - (n+1) c^{n+1} + c}{(c-1)^2}, c \neq 1, \sum_{i=0}^{\infty} i c^i = \frac{c}{(1-c)^2}, |c| < 1$$

## 7.7 Binomialkoeffizienten

$$\binom{n}{k} = \binom{n-1}{k} + \binom{n-1}{k-1}, \quad \binom{n}{m} \binom{m}{k} = \binom{n}{k} \binom{n-k}{m-k},$$

$$\binom{m+n}{r} = \sum_{k=0}^r \binom{m}{k} \binom{n}{r-k} \text{ and in general, } n_1 + \dots + n_p = \sum_{k_1+\dots+k_p=m} \binom{n_1}{k_1} \dots \binom{n_p}{k_p}$$

## 7.8 Catalanzahlen

$$C_n = \frac{1}{n+1} \binom{2n}{n} = \frac{(2n)!}{(n+1)!n!}$$

$$C_0 = 1, C_{n+1} = \sum_{k=0}^n C_k C_{n-k}, C_{n+1} = \frac{4n+2}{n+2} C_n$$

## 7.9 Geometrie

**Polygonfläche:**  $A = \frac{1}{2}(x_1 y_2 - x_2 y_1 + x_2 y_3 - x_3 y_2 + \dots + x_{n-1} y_n - x_n y_{n-1} + x_n y_1 - x_1 y_n)$

## 7.10 Zahlentheorie

**Chinese Remainder Theorem:** Es existiert eine Zahl  $C$ , sodass:

$$C \equiv a_1 \pmod{n_1}, \dots, C \equiv a_k \pmod{n_k}, \text{ggT}(n_i, n_j) = 1, i \neq j$$

Fall  $k = 2$ :  $m_1 n_1 + m_2 n_2 = 1$  mit EEA finden.

Lösung ist  $x = a_1 m_2 n_2 + a_2 m_1 n_1$ .

Allgemeiner Fall: iterative Anwendung von  $k = 2$

**Eulersche  $\varphi$ -Funktion:**  $\varphi(n) = n \prod_{p|n} (1 - \frac{1}{p})$ ,  $p$  prim

$$\varphi(p) = p - 1, \varphi(pq) = \varphi(p)\varphi(q), p, q \text{ prim}$$

$$\varphi(p^k) = p^k - p^{k-1}, p, q \text{ prim}, k \geq 1$$

**Eulers Theorem:**  $a^{\varphi(n)} \equiv 1 \pmod{n}$

**Fermats Theorem:**  $a^p \equiv a \pmod{p}$ ,  $p$  prim

## 7.11 Faltung

$$(f * g)(n) = \sum_{m=-\infty}^{\infty} f(m)g(n-m) = \sum_{m=-\infty}^{\infty} f(n-m)g(m)$$

## 8 Java Knowhow

### 8.1 System.out.printf() und String.format()

**Syntax:** %[flags][width][.precision][conv]

**flags:**

- left-justify (default: right)
- + always output number sign
- 0 zero-pad numbers
- (space) space instead of minus for pos. numbers
- , group triplets of digits with ,

**width** specifies output width

**precision** is for floating point precision

**conv:**

- d byte, short, int, long
- f float, double
- c char (use C for uppercase)
- s String (use S for all uppercase)
